

S1 Figure A

By experimental group

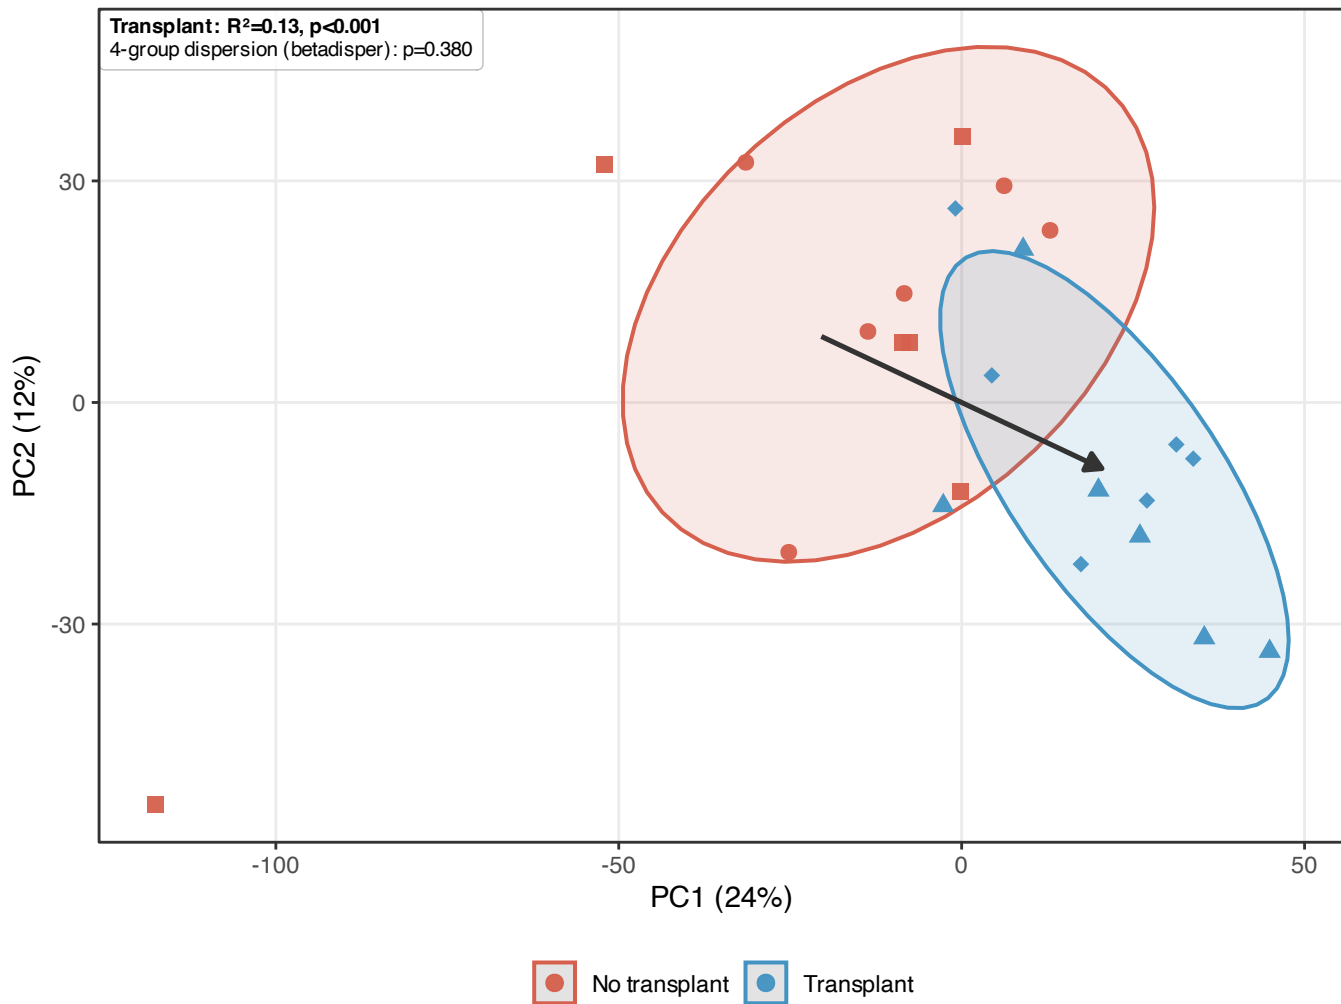

80% ellipses; arrows = centroid shift from CTL; factorial PERMANOVA

S1 Figure B

Transplant vs no-transplant (mito contrast)

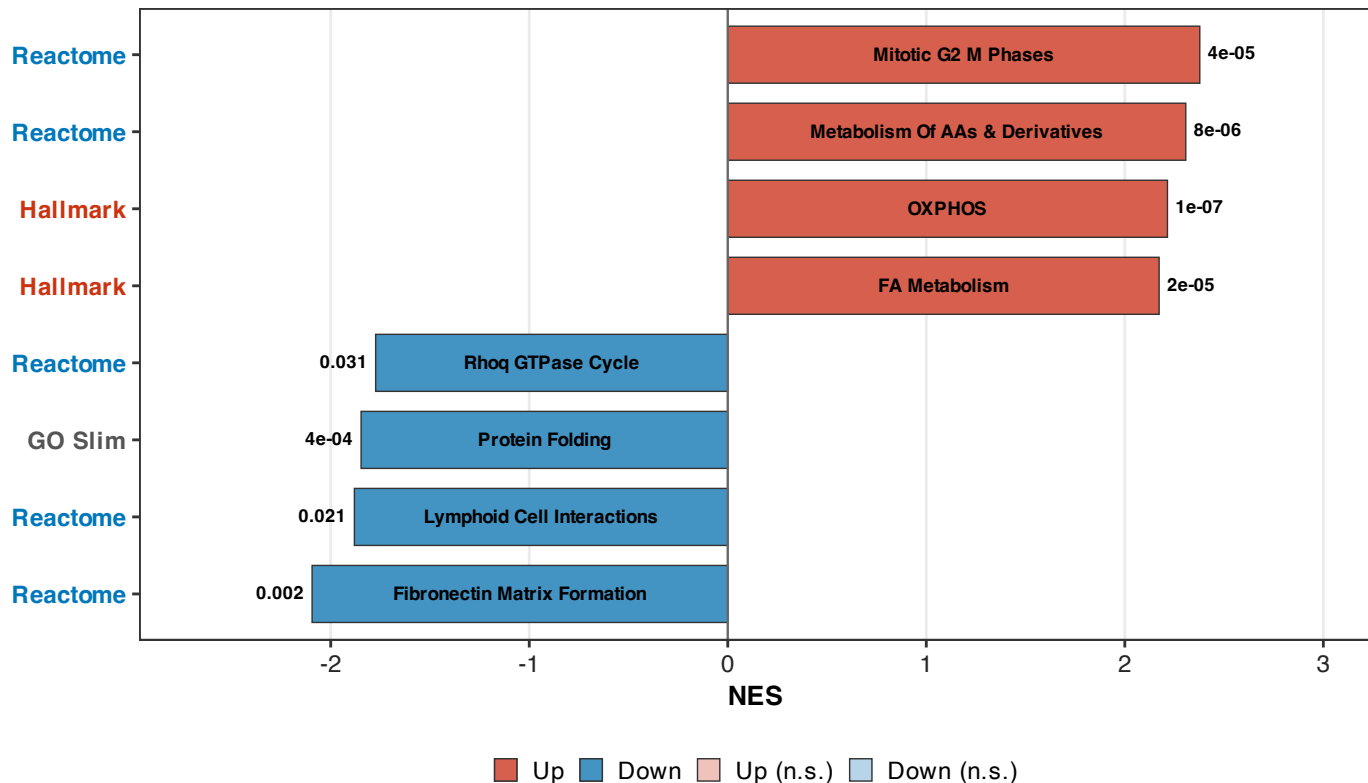

points coloured by transplant, shaped by group; arrow = centroid shift

S1 Figure C

PC1 (24% of variance)

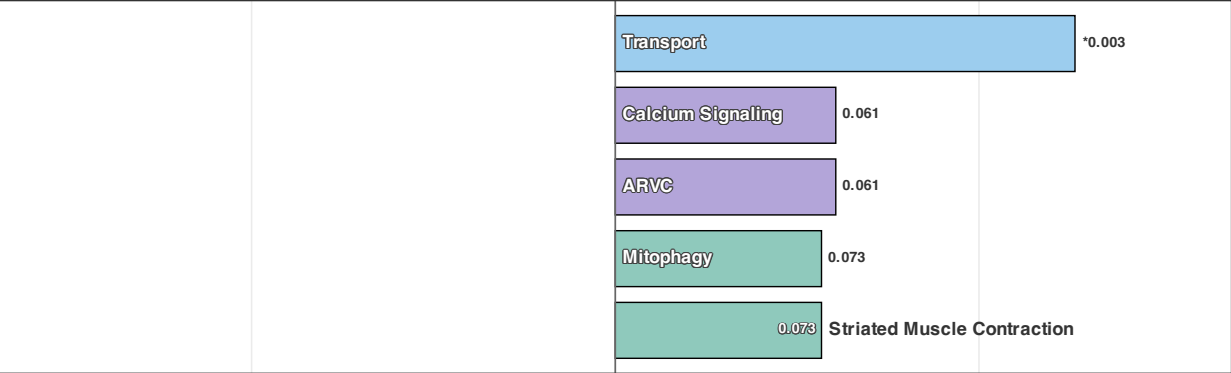

fgsea on the signed PC1 loadings, 5-DB lens, EnrichmentMap-deduplicated; + = transplant end, - = control end

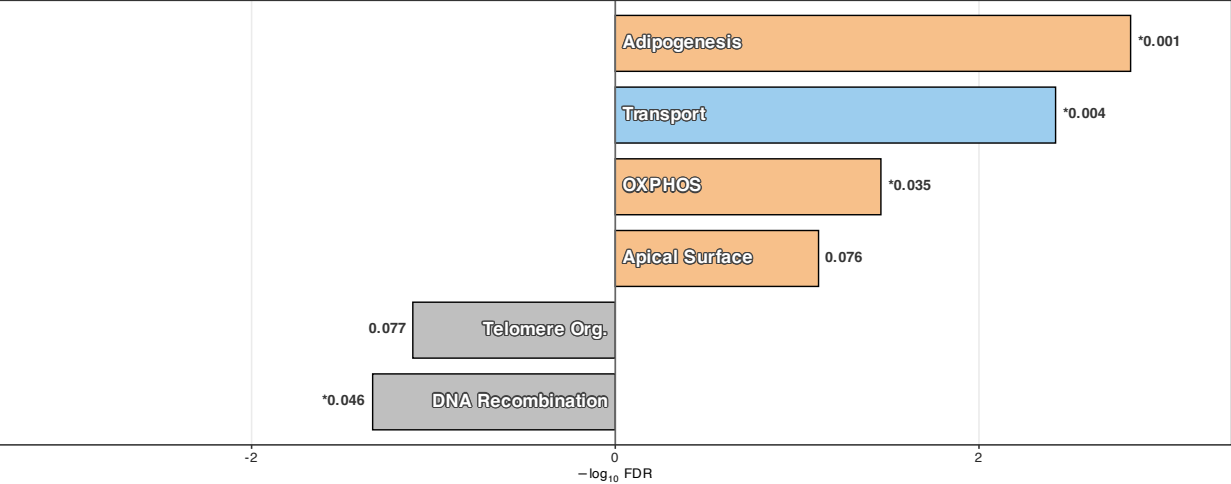

S1 Figure D

ORA of the significant proteins per contrast

Disease / Transplant / Rescue; over-representation on the 5-DB pool, EnrichmentMap-deduplicated; FDR < 0.10 (* = FDR < 0.05); left = down, right = up; bar = -log10 FDR; colour = database (no enrichment: Disease)

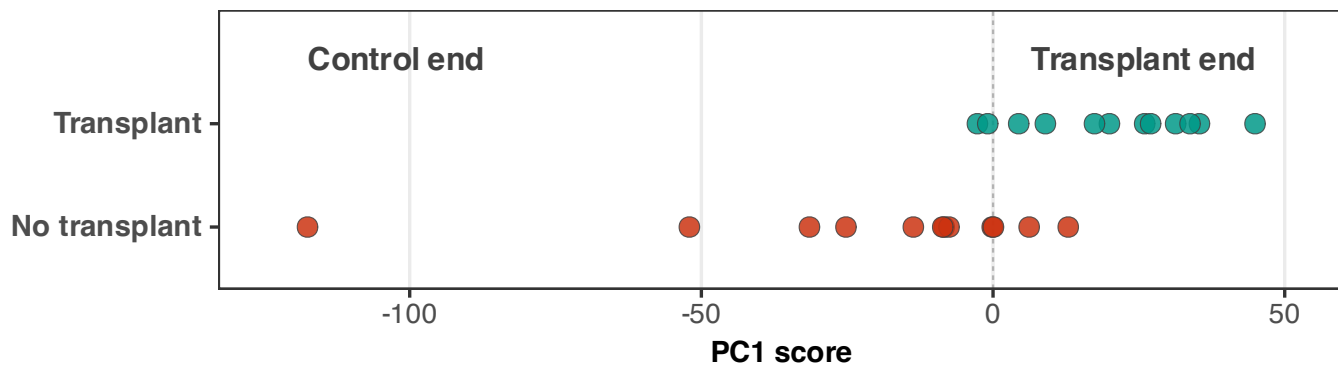

Transplant

Rescue

PC1 score by transplant status

One dot per sample. PC1's sign is arbitrary, so it is flipped to put transplanted cells on the right

Compartment membership at each end of PC1

Share of the 500 strongest PC1 loadings at each end
