

By experimental group

80% ellipses; arrows = centroid shift from CTL; factorial PERMANOVA

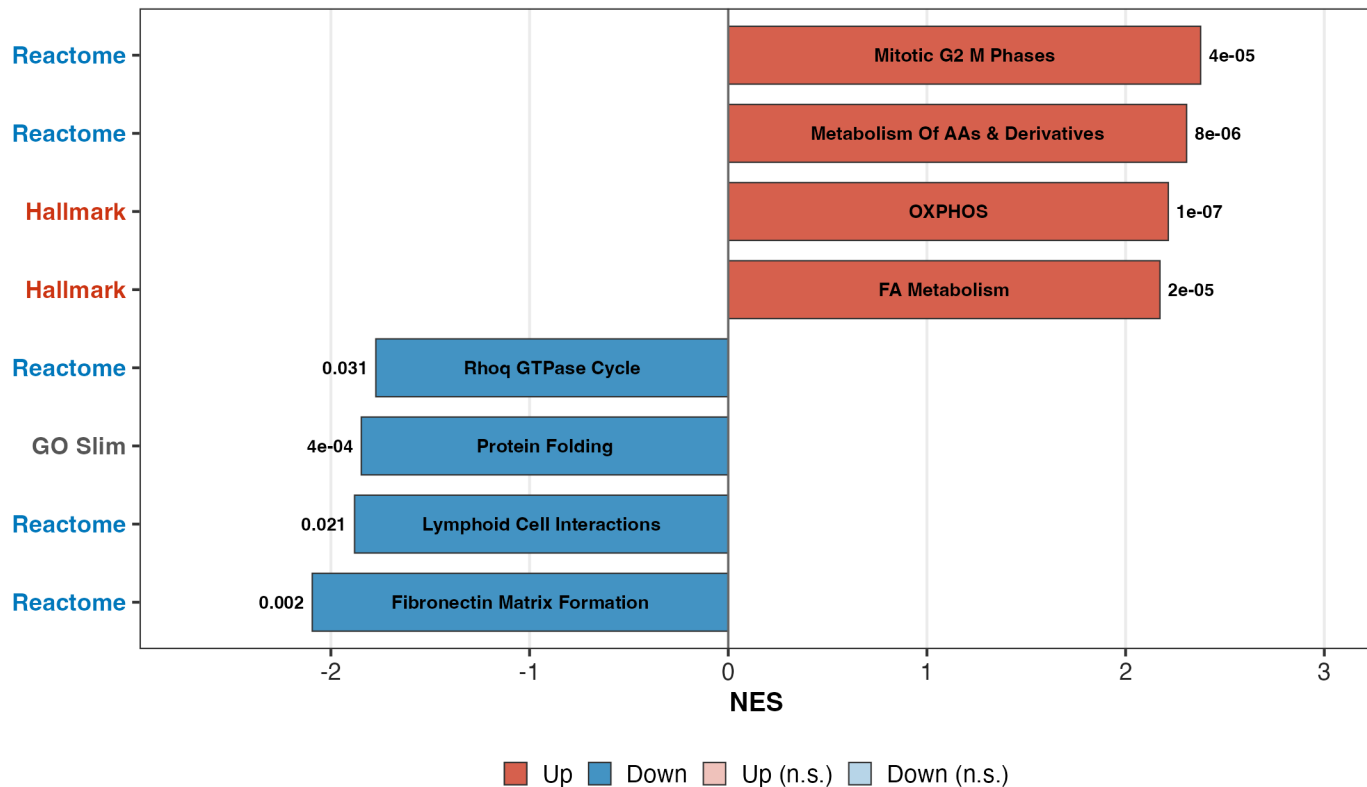

Transplant vs no-transplant (mito contrast)

points coloured by transplant, shaped by group; arrow = centroid shift

PC1 (24% of variance)

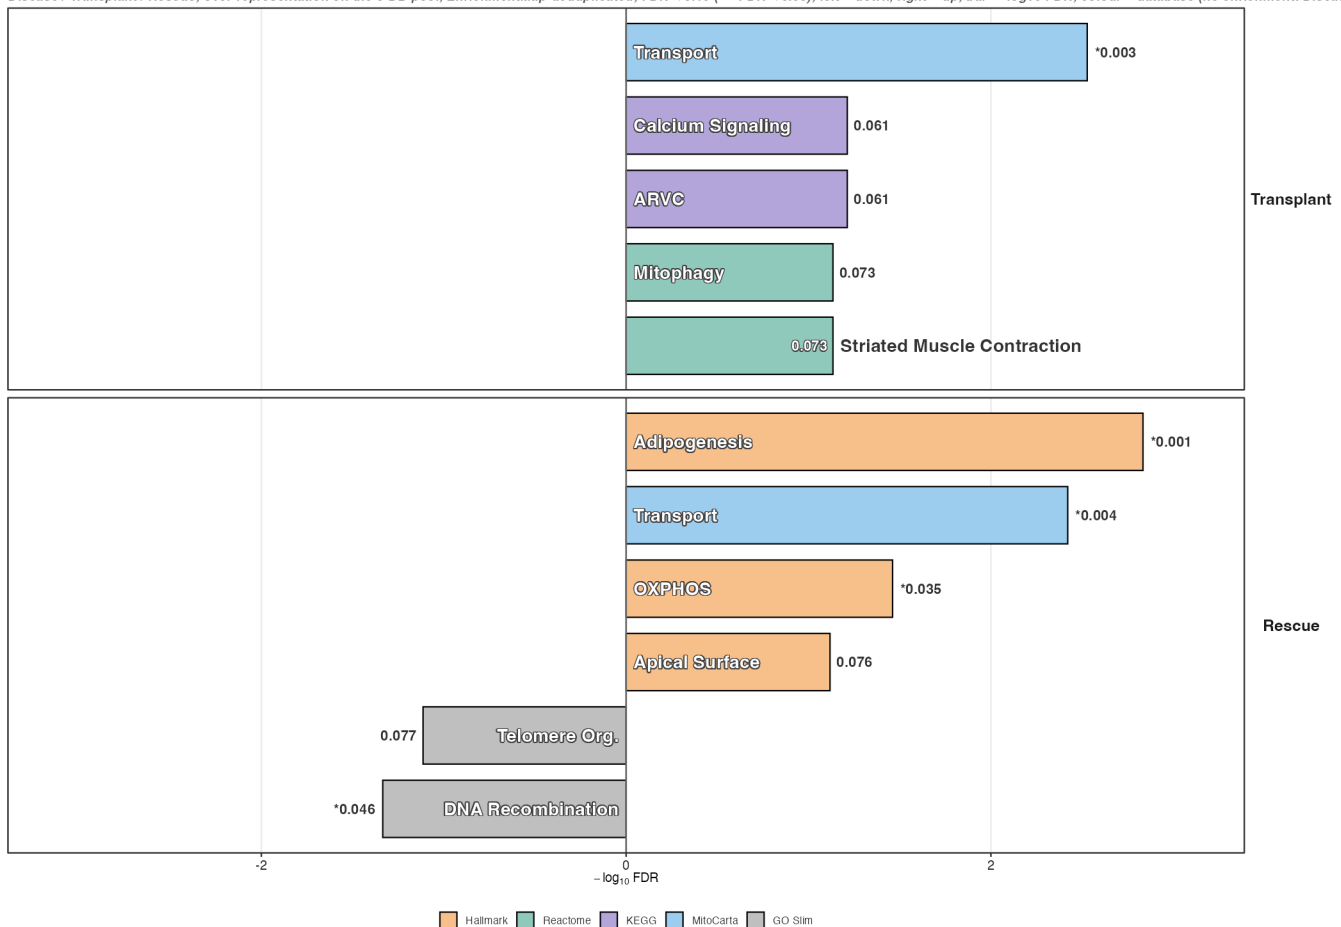

fgsea on the signed PC1 loadings, 5-DB lens, EnrichmentMap-deduplicated; + = transplant end, - = control end

S1 Figure D (page 4 of 5)

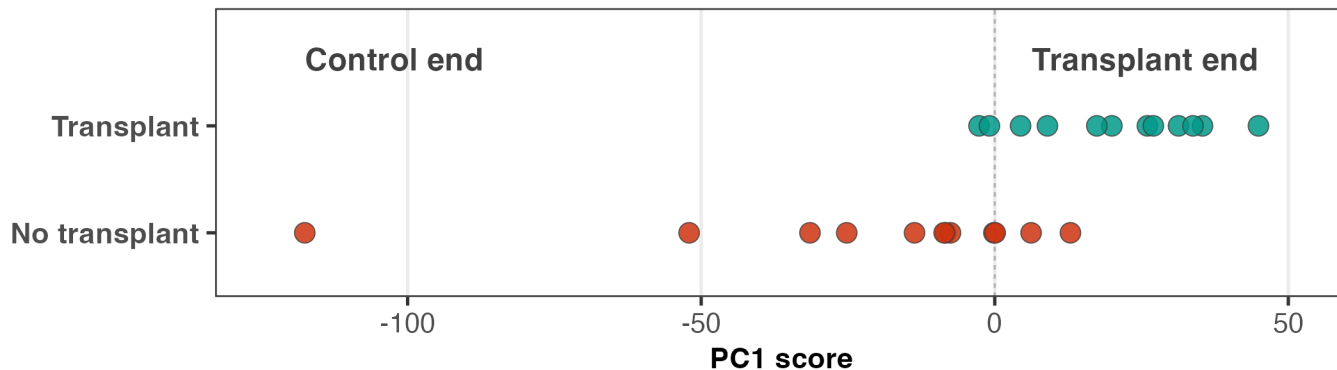

ORA of the significant proteins per contrast

Disease / Transplant / Rescue; over-representation on the 5-DB pool, EnrichmentMap-deduplicated; FDR < 0.10 (* = FDR < 0.05); left = down, right = up; bar = -log₁₀ FDR; colour = database (no enrichment: Disease)

PC1 score by transplant status

One dot per sample. PC1's sign is arbitrary, so it is flipped to put transplanted cells on the right.

Compartment membership at each end of PC1

Share of the 500 strongest PC1 loadings at each end
