

S2 Figure A (page 1 of 3)

Pathway enrichment by contrast

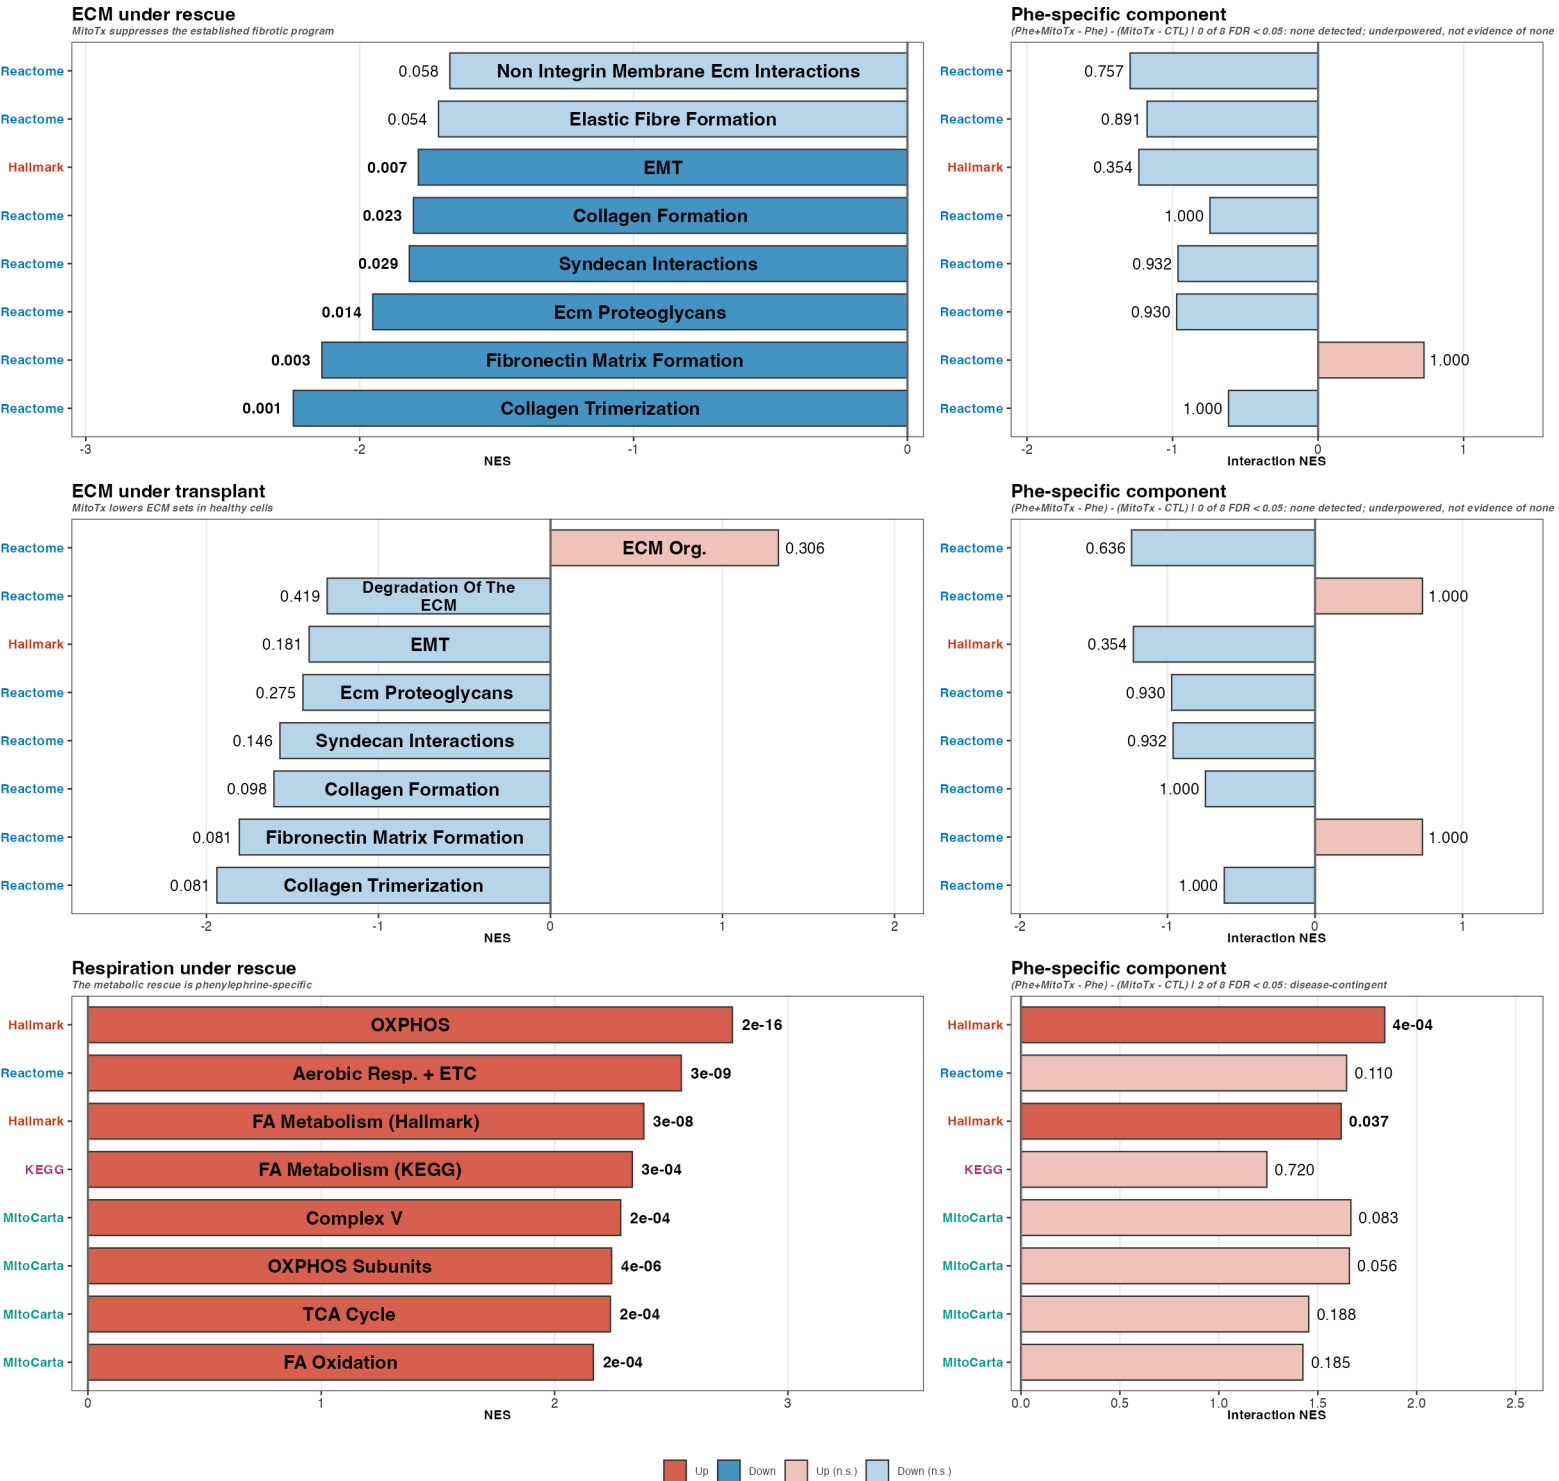

Top 8 themed gene sets per contrast — Disease (Phe vs CTL), Transplant (MitoTx vs CTL), Rescue (Phe+MitoTx vs Phe), fgsea NES, per-database BH-FDR, EnrichmentMap-deduplicated. Sets trace to the fgsea supplementary table.

S2 Figure B (page 2 of 3)

Disease-specificity of the transplant response

Each read shows its main contrast beside the interaction (Phe+MitoTx - Phe) - (MitoTx - CTL), which isolates the disease-contingent component, Igsea NEG, per-database BH-FDR; sets from the Igsea supplementary table, not deduplicated so no named set is hidden.

Up Down Up (n.s.) Down (n.s.)

S2 Figure C (page 3 of 3)

Disease-selected pathway sets read across contrasts

The four ECM and four proliferation sets phenylephrine moves most under Disease, read under Disease, Rescue and Transplant (names on the Disease column; rows shared). One set clears FDR < 0.05 under Rescue; Disease and Rescue share the Phe group and are coupled by design, so this apparent reversal is descriptive only. Igsea NES, per-database BH-FDR.
